In both CH₄ & H₂O the valence electrons are shared to form covalent bonds. Explain, in terms of valence electrons, why the bonding in HCl is different than that bonding in NaCl. In HCl the valence electrons are shared to form a covalent bond. In NaCl, the valence electrons are transferred from the Na to the Cl to form an ionic bond.

COVALENT BONDING Compounds that form between two nonmetals have covalent bonds, sharing electrons. Covalent bonds are weaker than ionic bonds. Covalent compounds have low melting points, are generally gases, liquids, or powdery solids at room temperature, and never conduct. These are also known as molecular compounds. a.

Therefore, covalent bonding is found in nonmetallic elements and in nonmetallic compounds. Covalent bonds are intramolecular forces; that is, they are inside the molecule and hold the atoms together to make the molecule. Covalent bonds are strong bonds and it is difficult and requires a lot of energy to break a molecule apart into its atoms.
