Metallic Material Testing Standards focus on hardness, tensile, and fatigue testing, approaching the issues from multiple angles to provide a range of information. In addition, metallic material testing standards cover corrosion testing, weld testing, and other areas of interest. Together, standardized testing provides valuable information to determine the reliability of metallic materials and the products and structures using them.

1.1 These test methods describe notched-bar impact testing of metallic materials by the Charpy (simple-beam) test and the Izod (cantilever-beam) test. They give the requirements for: test specimens, test procedures, test reports, test machines (see Annex A1) verifying Charpy impact machines (see Annex A2), optional test specimen configurations (see Annex A3), designation of test specimen ...

1. Scope. 1.1 These test methods cover the tension testing of metallic materials in any form at room temperature, specifically, the methods of determination of yield strength, yield point elongation, tensile strength, elongation, and reduction of area. 1.2 The gauge lengths for most round specimens are required to be 4D for E8 and 5D for E8M.

Metallography is defined as the study of components and physical structure of metals. In order to perform mechanical tests on materials such as hardness testing, metallography is of great support in testing the quality of your metals. Metallography is a destructive testing method which can be conducted in accredited laboratories.
